Intelligence at the edge of real-world operations

Intelligence is most useful where the work happens — giving machines and planners a shared, up-to-date view of the site.

Useful where the work happens

Much of construction's information lives far from the work itself — in offices, reports and files that are out of date by the time they are read. Yet the decisions that matter are made on site and in the field: where a machine moves next, whether a slope is behaving as expected, what has changed since yesterday. The question is how intelligence can help there, in real conditions, rather than only after the fact.

A shared, current view of the site

Anton Solutions works towards sites where machines and planners share an up-to-date view of conditions. Digital Eye gives a living picture of every site, with early warning of change before it becomes failure, and Construck slopes can report their own condition. From observation to action, every step stays reviewable and safe — so teams act sooner and with confidence.
