Why interoperable platforms matter

Products that work together where it helps the customer — one trusted identity, connections to the systems customers already use, and every action permitted and traceable.

Working together where it helps

Customers rarely use one service in isolation. A project team, a retailer or a patient moves between several tools in a day, and every repeated login, re-keyed record or lost hand-over costs time. Products earn their place when each does its own job well and connects with the others wherever that saves the customer effort.

The benefit is less repeated searching and clearer coordination — not unrestricted sharing.

One trusted identity

AXpress offers one trusted identity for many services, starting with faster, safer healthcare — private by default. People sign in once and are recognised across the services they choose, while each service sees only what it needs. AXpress is designed so that delivery and shopping apps never see health records.

Connected and accountable

Anton Solutions products connect with the systems customers already use, so information flows to where the work happens instead of being typed in twice. Origentity traces every construction product from specification to site, and that record stays intact wherever it travels.

Every action is permitted and traceable. People can see where information came from, who may use it and what has changed — the basis for trust between organisations working together.
